

## Smart Water Usage In Idyllwild

Water is one of the most important resources on Earth-it helps sustain, build, and nurture life. As humans, though, we do not see the importance of water-until the last minute, when there is little left. For the mountainous regions, it is especially vital to know how to conserve, and use water appropriately. Take Idyllwild for example, a small town located in the mountains of San Jacinto, where water conservation is essential. The primary water source in Idyllwild comes from natural resources, like rainfall and snowmelt. This is why it is important to use the water in Idyllwild wisely, since it is located in California's Southern Inland region. This region does tend to be more dry, and have smaller amounts of rainfall and snowmelt, especially during the dry seasons. In this essay we will explore some smart water usages when living in Idyllwild, why water conservation is so important, and how you can incorporate it in your daily life.

Because the primary source of water in Idyllwild comes from rainfall and snowmelt, it is important to understand that knowing how to conserve water is crucial in this area. The Idyllwild Water District plays a role in providing safe, and clean water for the town. Here is what they state: "Water in the mountains is a premium commodity-one that we shouldn't waste." This emphasizes the point that knowing how to conserve as much water as possible is very important. Since Idyllwild relies on natural water resources, everyone should take part in understanding water conservation. Especially through the dry seasons. Water conservation in Idyllwild is extremely vital!

Since water conservation is so necessary in Idyllwild, how can you incorporate it in your daily life? To start off, conserving water isn't just about taking a shorter shower, or turning off the faucet when brushing your teeth. While those examples of water conservation are still very efficient, here are a couple ways you can be water-smart even more! You may have a small outdoor garden, or a patch of land with flowers. Well, think about how much water it would take to irrigate that garden, or patch of land. It probably takes a lot, especially for big land areas, so installing a rain barrel, or a smart watering system can really help with conserving water. Another way you can be water-smart is looking out for leaks. Leaks can waste a lot of water if gone unnoticed for a very long time, so when you notice a leak it is always best to fix it right away, rather than put it off. These can just be a few steps to help conserve water, but they can make a big difference in Idyllwild's water conservation!

As global temperatures continue to change, water conservation should not only be limited to local concerns, or dry seasons. It should also become a priority all around the globe. The changes in global temperatures may also bring some unpredictable effects, making water conservation more important to consider. If towns, or communities could encourage people to think about ways to conserve water, a better future would be established for everyone. If you consider Idyllwild's unpredictable mountainous climate, being water-smart would greatly improve the town. Water conservation should be taken more seriously, both locally, and world-wide.

To conclude, water conservation plays an important role in people's everyday lives. It benefits towns like Idyllwild that get some dry seasons. It also can greatly improve the future world-wide. If at least every person could take a moment to think of any big-or-small ways that they can conserve water. Like fixing leaks, turning off the faucet when brushing your teeth, installing smart water systems, etc. The future of the world would greatly improve. So, the next time you brush your teeth or water the plants in your garden, stop and think about how you can be water-smart. Because water is a valuable resource that everyone depends on!
